                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                         This sequence represents a chimeric protein containing the first and second kunitz-type domain derived from tissue factor pathway inhibitor (TFPI). This sequence has a Lys to Arg mutation in the PI-reactive domain of the first Kunitz-type domain, and an Asn to Gln mutation in the PI-reactive domain of the second Kunitz-domain. The Kunitz-type domains are highly basic sequences and may be involved in cell surface localisation by glycosaminoglycan (including heparin) or phospholipid binding. Chimeric proteins such as this, having one or more substitutions exclusively in the PI-reactive site of one or more kunitz-type domains are covered within the scope of the invention. Chimeric proteins comprising the kunitz-type domains from TFPI or TFPI-2, may also comprise an alternative glycosaminoglycan binding peptide selected from those given in AAR92266-73. The chimeric proteins and muteins may be used in a pharmaceutical composition for the may be generally useful in the treatment of diseases caused by the muteins may be generally useful in the treatment of diseases caused by the muteins may be generally useful in the treatment of diseases caused by the may expenditation of tissue factor bought on by injury, trauma, endotoxin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0

```
This sequence represents a mutein of tissue factor pathway inhibitor (TFPI). This sequence has a Lys to Arg mutation in the Pi-reactive domain of the first Kunitz-type domain. The Kunitz-type domains are highly basic sequences and may be involved in cell surface localisation by glycosaminoglycan (including heparin) or phospholipid binding.

Wuteins such as this, having one or more substitutions exclusively in the Pi-reactive site of one or more Kunitz-type domains are covered by the scope of the invention. Chimeric proteins comprising the kunitz-type domains from TFPI or TFP-2, may also comprise an alternative glycosaminoglycan binding peptide selected from those given in a pharmaceutical composition for the treatment of sepsis, septic shock and thrombosis disorders. The proteins may be generally useful in the treatment of diseases caused by the up-regulation of tissue factor bought on by injury, trauma, endotoxin, TNF, cancer, IL-1 or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 GNONRFESLEECKKMCTRDNANRIKTTLQQEKPDFCFLEEDPGICKGYITRYFYNNQTK 120

                                         tissue factor, Factor-Xa; binding protein; tissue factor inhibitor;
lipoprotein associated coagulation inhibitor;
extrinsic pathway inhibitor; sepsis; septic shock;
                                                                                                                                                                                                                                                                                                                                                         A mutein (AAR92012) of tissue factor pathway inhibitor (TFPI) is prepd. by site-directed mutagenesis of an encoding sequence. In the mutein, the lysine residue in the PI reactive site of the first Kunitz-type domain of TFPI is replaced by arginine. This domain is required for the inhibition of Factor-VIIa/Lissue factor (TF) complex. The mutein may be expressed in Saccharomyces cerevisiae transformants, esp. as a ubiquitin fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Angiotensin converting enzyme (ACEV) splice variant protein #71.

The sequence represents an angiotensin converting enzyme splice variant (ACEV) polypeptide. The polypeptides of the invention include variants of granulocyte colony stimulating factor receptor, glucagon, interleukin 6, platelet-derived endothelial cell growth factor, cyclin-dependent kinase inhibitor IC, cellular tumour antigen PS3, and vasoative intestinal polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection of candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosts of various consistince including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertropphy, immune complex nephritis, multiple sclerosis, cancer, sarcoidosis, nonarcoidottic pulmonary granulomatous diseases such as asbestosis and vascular pathologies involving an endothelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel alternative splicing variants e.g. variant of anglotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies

This sequence represents the human tissue factor pathway inhibitor (TPPI) protein. TPPI is also known as Lipoprotein-associated coagulation inhibitor (LACI), extrinsic pathway inhibitor (EPI) and Tissue factor inhibitor (TPI). The DNA encoding this sequence was altered to contain the optimum codons for expression in E. coli, to allow for expression of this protein in the bacteria. TPPI is used in the aqueous formulation of the invention. The aqueous formulation also includes a charged polymer (CP), preferably a sulphated polysaccharide (such as heparin or dextran sulphate) or a polyphosphate, preferably immobilised on a solid support. The CP is added to aid the correct refolding of TPPI. TPPI can also be modified or refolded using the methods of the invention. One method is for nedicting the solubility of a protein, by adding an aqueous solution of a CP to reduce inter- and intra-molecular interactions between the charged domains of the protein (e.g. TFPI), and comprises adding CP to a solution of the protein (e.g. TFPI), and comprises adding CP to a solution of the protein prior to allowing the protein to refold. The methods are particularly useful for solubilising, formulating, purifying and refolding proteins (especially TFPI) which have been engineered by genetic recombination and produced in bacterial, yeast or other cells in a form that has a non-native tertiary structure. TFPI is a coagulation inhibitor which has clot-inhibiting properties.
                                                                                   Tissue factor pathway inhibitor; TFPI; human; tissue factor inhibitor; ilpoprotein-associated coagulation inhibitor; coagulation inhibitor; TFI; LACI; extrinsic pathway inhibitor; protein refolding; clot-inhibitor; protein solubility modification; EPI.
                                                                                                                                                                                                                                           /note= "phosphorylated to varying degrees, but does not
  affect TFPI function"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         charged polymer, e.g. dextran sulphate, to facilitate solubilisation, formulation purification and refolding of protein

                                                                                                 The present sequence represents the human tissue factor pathway inhibitor (TFPI). The invention provides compositions using TFPI and its homologs, e.g.TFPI-2 (AAM61586), for inhibiting cell proliferation. The compositions are claimed to be useful for inhibiting an angiogenesis-related disease, such as cancer, arthritis, macular
                                                                                                                                                                                                                                                                                                                                               61 GNONRFESLEECKKMCTRDNANRIIKTTLQQEKPDFCFLEEDPGICRGYITRYFYNQQTK 120

AAR81884 is the human lipoprotein-associated coagulation inhibitor LACI. The Kunitz domain, LACI-KI, of LACI is a kallikrein inhibiting protein (KIP) upon which the claimed KIPs of the invention are based. The KIPs can be used for treating or preventing disorders attributable to excessive kallikrein activity, e.g. hereditary angloedema. The KIPs can also be used for assaying, purifying and in vivo imaging of kallikrein.

The nucleic acids, and primers and probes, are used to identify polymorphisms, which may predispose an individual to disease, sepecially a vascular disease. They can also be used in phenotype correlations, forensics, paternity testing, medicine or genetic analysis. AAY49550 to AAY49573 represent the proteins which correspond

                                A SalI fragment encoding human tissue factor pathway inhibitor (TFPI) is given in AA081396. It was used to contruct expression vectors allowing production of FFPI in Saccharomyces cerevisae as fusions to the yeast aspartic protease 3 (YAP3) signal peptide, facilitating secretion of the recombinant TFPI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inhibiting Factor VIIa/tissue factor enzymatic complex formation Factor VIIa is the activated form of factor VII.
following transformation with vector plasmid pLACI 4.1, which carries a ubiquitin/TFPI gene fusion (AAT16056). The fusion protein is cleaved within the yeast cell, so that mature TFPI having an authentic N-terminal sequence (see AAR2013) is obtd. Max. prodn. of TFPI from yeast transformants reached I mg/ml. TFPI is used to treat or prevent sepsis and septic shock.

include: highly negatively charged N-terminal; highly positively charged carboxy-terminal; intervening portion consisting of 3 homologous domains with sequences typical of Kunitz-type enzyme inhibitors. Based on homology study, it appears to be a member of the basic protease inhibitor gene superfamily. Sequences in misc. regions in feature table above have been independently confirmed by amino acid sequence analysis.
                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                   61 GNQNRFESLEECKKMCTRDNANRIIKTTLQQEKPDFCFLEEDPGICRGYITRYFYNQQTK 120
                                                                                                                                                                                                                        kunitz domains of native EPI and have one or more amino acids deleted in the region Glu148 to the C-terminal Met276, especially in the region from Arg246 to Ly8275. This analogue is an example of such a peptide; it corresponds to amino acids 1 to 255 of native EPI with an additional N-terminal Ser residue. The analogue can be used in a therapeutic composition to treat patients having coagulation disorders or cancer. The analogue has a longer half-life than

This analogue is an example of such a peptide; it has amino acids 246 to 261 of native EPI deleted with an optional N-terminal Ser residue. The analogue can be used in a therapeutic composition to treat patients having coagulation disorders or cancer. The analogue has a longer half-life than

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preferred EPI analogues of the invention comprise the first two kunitz domains of native EPI and have one or more amino acids deleted in the region Glu148 to the C-terminal Met276, especially in the region from Arg246 to Lys275. This analogue is an example of such a peptide; it has amino acids 249 to 263 of native EPI deleted with an optional N-terminal Ser residue. The analogue can be used in a therapoutic composition to treat patients having coagulation disorders or cancer. The analogue has a longer half-life than
                                                                                                                                                                                                                                                             Extrinsic pathway inhibitor protein; tissue plasminogen activator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

TPFDbeta, a second pare ";

Inhibitor (TPPI) gene.";

Thromb. Haemost. 81:45-49(1.999).

-!- FUNCTION: INHIBITS FACTOR X (X(A)) DIRECTLY AND, IN A XA-DEPENDENT WAY, INHIBITS YII(A)/TISSUE FACTOR ACTIVITY, PRESUMABLY BY FORMING A QUATERNARY X(A)/LACI/VII(A)/TF COMPLEX. IT POSSESSES AN ANTITHROMBOTIC ACTION AND ALSO THE ABILITY TO ASSOCIATE WITH LIPOPROTEINS IN PLASAMA (BY SIMILARITY).

-!- ALTERNATIVE PRODUCTS: 2 isoforms; alpha/TFPIalpha (shown here) and beta/TFPIDeta; are produced by alternative splicing.

-!- ALTERNATIVE PRODUCTS: 1 isoform alpha is expressed in heart and beta/TFPIDETCHY: Isoform alpha is expressed in heart and lung.

-!- SUBMELLICITY: Isoform beta in heart and lung.

-!- SUBMELLICITY: CONTAINS 3 BPTI/KUNITZ INHIBITOR DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. Biochem. Biophys. Res. Commun. 151:650-631(1988).

-!- FUNCTION: SEEMS TO INHIBIT TRYPSIN, FACTOR VII(A)/TISSUE FACTOR,
WEAKLY FACTOR XA. HAS NO EFFECT ON THROMBIN.

-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: UMBILICAL VEIN ENDOTHELIAL CELLS, LIVER,
PLACENTA, HEART, PANCREAS, AND MATERNAL SERUM AT ADVANCED
PREGNANCY.
                                                                                                                                                                                                  PubMed=1134222;
